1 Question 1

1.1 Question

Explore the friendship paradox for your Twitter account. Since Twitter has directional links (i.e., "followers" and "following"), we'll be investigating if the people you follow (Twitter calls these people "friends") follow more people than you. If you are following < 50 people, use my twitter account "phonedude_mln" instead of your own.

Create a graph of the number of friends (y-axis) and the friends sorted by number of friends (x-axis). (The friends don't need to be labeled on the x-axis as "Bob", "Mary", etc. -- just 1, 2, 3 ...) In other words, if you have 100 friends your x-axis will be 1..101 (100 + you), and the y-axis value will be number of friends that each of those friends has. The friend with the lowest number of friends will be first and the friend with the highest number of friends will be last.

Do include yourself in the graph and label yourself accordingly. Compute the mean, standard deviation, and median of the number of friends that your friends have.

The appropriate part of the Twitter API to use is:

https://dev.twitter.com/rest/reference/get/friends/list

1.2 Answer

Using Dr. Michael Nelson's Twitter account and the Twitter API [1], specifically the GET friends/list [2] request, all of Dr. Nelson's Twitter friends were obtained and saved to the file called friends. This method also uses the API's paginating scheme: when there are a large number of results for a query, the API will send a cursor index to show that there are more results to process and that more requests are needed. The code to do this is in Listing 1.

```
def get_friends(screen_name):
    print("Getting {}'s friends".format(screen_name))
38
39
        friends = []
40
        next\_cursor = -1
41
        limit, reset = get_limit()
while True:
42
43
             if limit == 0:
44
45
                 limit, reset = wait for reset(reset)
            response = requests.get(SEARCH_URI, params={'screen_name':screen_name, 'cursor':next_cursor, 'count':200}, auth=OAUTH)
46
47
48
             if not response:
                 print("Bad response: {}".format(response.reason))
49
50
                  return []
             limit = limit - 1
51
52
             data = json.loads(response.text)
             print("Got {} friends, limit: {}".format(len(data['users']), limit))
53
54
             next_cursor = data['next_cursor']
55
             friends.extend(data['users'])
56
             if next cursor == 0:
                  return [friend['screen_name'] for friend in friends]
```

Listing 1: Getting the friends list

To reduce the impact of high HTTP traffic, the Twitter API rate-limits most requests – the one needed to obtain a user's friends list has a limit of fifteen message per fifteen minutes. Any requests received from a user or service that has reached the limit will be denied. To ensure no HTTP requests are sent after the limit has been reached the script will sleep until the limit resets. This is accomplished using Python's time package [3] and the methods shown in Listing 2.

```
^{24}
       get limit():
        response = requests.get(LIMIT URI, params={'resources':'friends'}, auth=OAUTH)
^{25}
26
        data = json.loads(response.text)
        remaining = data['resources']|'friends']['/friends/list']['remaining']
reset = data['resources']|'friends']|'/friends/list']['reset']
27
28
29
        return remaining, reset
30
   def wait_for_reset(reset):
        naptime = reset - time.time() + 5
        print("Limit reached, sleeping for {}".format(naptime))
33
34
        time.sleep(naptime)
        print("Time to get up and go to work") # https://www.youtube.com/watch?v=ChP6SfmZVSE
        return get limit()
```

Listing 2: Waiting for API request limit reset

The get_limit method uses the API to find the number of available requests remaining for the GET friends/list method and also the time at which the limit will reset, received as seconds since the Unix epoch [4]. This method, combined with the wait_for_reset method, allowed the script to restart after an interruption and only require waiting for the appropriate amount of time. The sleep time was extended by 5 seconds to allow for a small buffer in case of mathematical errors.

The friends of Dr. Nelson's friends were then obtained with the same get_friends method from Listing 1 and stored in a file called friend_counts, each on a single line preceded by their friend count. All of these operations were controlled by a main method, which is shown in Listing 3.

```
__name_ = ·____
___ ret list of MLN's
59
               == '__main__':
                            friends from previously run get friends method
60
       with open ('friends') as infile:
61
           friends = [line.strip() for line in infile]
62
63
       # initialize map of MLN's friends' friend counts
64
       friend counts = {friend:0 for friend in friends}
65
66
67
       # get MLN's friends' friend counts which have already been processed
       with open('friend_counts') as infile:
68
69
           for line in infile:
70
               count, friend = line.strip().split(',')
               friend counts [friend] = count
71
72
       # process the rest
73
74
       for friend, count in friend_counts.iteritems():
           if count > 0 and friend != 'phonedude_mln';
75
76
                friends.remove(friend)
77
       with open ('friend_counts', 'a') as outfile:
78
               friend in friends:
                friend_list = get_friends(friend)
79
80
                if friend list is None:
81
                outfile.write('{} {}\n'.format(len(friend list), friend))
```

Listing 3: Main method

The friend_counts file was ordered in place with the Unix command in Listing 4.

```
1 [mchaney@mchaney-l a5] $ cat friend_counts | sort -g -o friend_counts
```

Listing 4: Sort command

This file was then processed by the R script shown in Listing 5 to produce the graph in Figure 1

```
#! /usr/bin/Rscript
     3
                # read data
      4 data <- read.table('friend_counts')
    8 # get notable values
9 mln_idx <- grep("phonedude_mln", data$V2)
10 med_val <- median(data$V1)
\begin{array}{lll} & & & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\
 14 std_dev <- sd(data$V1)
 15
16
                \# draw the graph
               pdf("friend_plot.pdf")
plot(x, y, type="l", log="y", pch=19, main="Dr. Nelson's Friends' Friends",
    ylab="Number of Friends", xlab="Index of Friend")
 17
19
20
20  # illustrate points of interest
22  abline(h=data$V1[mln_idx], col="red")
23  abline(h=data$V1[med_idx], col="blue")

25  abline(h=med_val + std_dev, col="purple")
26
27
                  # The Legend of the Data
               # The Legend of the Data
legend(x=82, y=5, cex=0.8, lty=c(1, 1),
    col=c("red", "blue", "darkolivegreen3", "white", "purple"),
    c(paste("Nelson: ", data$V1[mln_idx]), paste("median: ", med_val),
        paste("mean: ", format(round(mean_val, 4), nsmall = 4)),
        paste("std dev: ", format(round(std_dev, 4), nsmall = 4)),
        paste("median + 1 std dev: ", format(round(med_val + std_dev, 4), nsmall = 4))))
28
29
30
31
32
33
                dev.off()
```

Listing 5: Graph Creation Script

The median, mean and standard deviation were all calculated, with the median, mean and median plus one standard deviation plotted as horizontal lines that intersect the data plot at their y-values. Only a single line was drawn for the standard deviation because the lower-end value was negative, and thus off the graph.
